

Supplementary material

Appendix 1 – Definition of contaminants

Definition of contaminants

Bacillus species

Coagulase-negative *Staphylococcus*

Corynebacterium species (diphtheroids)

Micrococcus species

Cutibacterium (previously *Propionibacterium*)

Alpha-haemolytic *Streptococcus* (other than *Strep. pneumoniae*)

Pseudomonas (other than *P. aeruginosa*)

Other environmental non-fermenting gram-negative rods

Appendix 2 – Eligible articles reporting on typhoid incidence

Citation	First author	Publication year	Title	Project	Notes
1	Chanthavilay	2020	Estimation of Incidence of Typhoid and Paratyphoid Fever in Vientiane, Lao People's Democratic Republic		Included
2	Cutting	2022	Facility-based disease surveillance and Bayesian hierarchical modeling to estimate endemic typhoid fever incidence, Kilimanjaro Region, Tanzania, 2007–2018		Not included because overlap with TSAP
3	Garrett	2022	Incidence of typhoid and paratyphoid fever in Bangladesh, Nepal, and Pakistan: results of the Surveillance for Enteric Fever in Asia Project	Surveillance for Enteric Fever in Asia Project (SEAP)	Data from study sites Pakistan and Nepal are included
4	John	2018	Estimating the incidence of enteric fever in children in India: a multi-site, active fever surveillance of pediatric cohorts	Surveillance of Enteric Fever in India (SEFI)	Data from study site Vellore included
5	Marks	2022	The Severe Typhoid in Africa Program: Incidences of Typhoid Fever in Burkina Faso, Democratic Republic of Congo, Ethiopia, Ghana, Madagascar, and Nigeria	Severe Typhoid in Africa Program (SETA)	Included: 5 study sites were not eligible as no typhoid incidence was reported. One study site Madagascar, Mahajanga was excluded because only <10 probable pathogens were isolated.
6	Marks	2017	Incidence of invasive salmonella disease in sub-Saharan Africa: a multicentre population-based surveillance study	Typhoid Fever Surveillance in Africa (TSAP)	Included
7	Meiring	2021	Burden of enteric fever at three urban sites in Africa and Asia: a multicentre population-based study	Strategic Typhoid Alliance across Africa and Asia (STRATAA)	Not included
8	Ng'eno	2023	Dynamic Incidence of Typhoid Fever over a 10-Year Period (2010-2019) in Kibera, an Urban Informal Settlement in Nairobi, Kenya		Not included because overlap with TSAP
9,10	Oo	2019	Incidence of Typhoid and Paratyphoid Fevers Among Adolescents and Adults in Yangon, Myanmar		Included, prevalence data abstracted from publication ¹⁰

11	Patel	2021	Safety and Efficacy of a Typhoid Conjugate Vaccine in Malawian Children	Typhoid Vaccine Acceleration Consortium (TyVAC) - Malawi	Data from the control arm included
12	Qadri	2021	Protection by vaccination of children against typhoid fever with a Vi-tetanus toxoid conjugate vaccine in urban Bangladesh: a cluster-randomised trial	Typhoid Vaccine Acceleration Consortium (TyVAC) - Bangladesh	Data from the cluster control arm are included
13	Shakya	2021	Efficacy of typhoid conjugate vaccine in Nepal: final results of a phase 3, randomised, controlled trial	Typhoid Vaccine Acceleration Consortium (TyVAC) - Nepal	Data from the control arm included
14	Yousafzai	2021	Effectiveness of typhoid conjugate vaccine against culture confirmed <i>Salmonella</i> enterica serotype Typhi in an extensively drug-resistant outbreak setting of Hyderabad, Pakistan: a cohort study		Not included.

Appendix 3 – Map of countries of the study sites of typhoid incidence and prevalence of community-onset bloodstream infections, published 2017-2024

Appendix 4 – Distribution of blood culture results across study sites, sorted from high typhoid incidence to low typhoid incidence study sites

SEAP, Surveillance for Enteric Fever in Asia Project (SEAP); SEFI, Surveillance of Enteric Fever in India; SETA, Severe Typhoid in Africa Program (SETA); TSAP, Typhoid Fever Surveillance in Africa.

Blood culture negative data were not available for Bangladesh, Dhaka.

Appendix 5 – Top five rank order probable pathogens isolated from bloodstream infections across study sites, sorted by highest typhoid incidence study site

Study site (Project, Country, Locality)	Reference	Number of probable pathogens	Top five rank order of probable pathogens: Isolate genus species (number of isolates)

CI, confidence interval; NA, not available; SETA, Severe Typhoid Fever Surveillance in Africa; TSAP, Typhoid Fever Surveillance in Africa Program. *Stably endemic organisms were defined as *E. coli*, *S. pneumoniae*, or *S. aureus*.

Appendix 7 – Association of metrics from bloodstream infections from sentinel sites with typhoid incidence by meta-regression and univariate ordinal regression analysis, 2017-2024

Metrics of sentinel bloodstream infection	Meta-regression for log typhoid incidence estimate	Univariate ordinal regression analysis for low, medium and high typhoid incidence estimate levels[±]
	Beta (95%CI)	OR (95%CI)
Each 1% increase in prevalence of <i>S. Typhi</i> among probable pathogens (n=29)	0.05 (0.03-0.07)	1.08 (1.04-1.17)
Each increase in rank order of <i>S. Typhi</i> among probable pathogens (n=28)	-0.97 (-1.39- -0.55)	0.24 (0.07-0.55)
Log <i>S. Typhi</i> to <i>E. coli</i> ratio (n=25)	0.86 (0.62-1.10)	2.91 (1.49-7.43)
Log <i>S. Typhi</i> to 'stably endemic organisms' ratio *(n=29)	0.84 (0.62-1.06)	3.75 (1.81-10.7)

OR, odds ratio

± Low typhoid incidence (<10/100,000 person-years); medium typhoid incidence (10-100/100,000 person-years); high typhoid incidence (>100/100,000 person-years)

*Stably endemic organisms were defined as *E. coli*, *S. pneumoniae*, or *S. aureus*.

Appendix 8 – Bubble plots of meta-regression of metrics from sentinel blood stream infections with log typhoid incidence (A, prevalence of *S. Typhi* among probable pathogens; B, rank order of *S. Typhi* among probable pathogens; C, ratio log *S. Typhi* to *E. coli* ratio; D, log ratio *S. Typhi* to ‘stably endemic organisms’ ratio)

Appendix 9 – Summary of model comparisons for metrics of bloodstream infections of sentinel sites for typhoid incidence level in ordinal regression analysis, 2017-2024

Models were compared using the likelihood ratio test and the AIC. Model selection was based on model performance, parsimony, and ease of implementation.

Model 1 Prevalence of *S. Typhi* of probable pathogens

Model 2 Rank order of *S. Typhi*

Model 2b Prevalence of *S. Typhi* of probable pathogens and rank order of *S. Typhi*

Model 3 Log ratio of *S. Typhi* to *E. coli*

Model 3b Prevalence of *S. Typhi* of probable pathogens and log ratio of *S. Typhi* to *E. coli*

Model 4 Log ratio of *S. Typhi* to 'stably endemic organisms'

Model 4b Prevalence of *S. Typhi* of probable pathogens and log ratio of *S. Typhi* to 'stably endemic organisms'

	P-value	AIC	Decision
Model 1 vs Model 2	0.33	37.4 vs 39.0	Keep model 1
Model 1 vs Model 2b	1	37.4 vs 38.5	Keep model 1
Model 1 vs Model 3	1	37.4 vs 38.5	Keep model 1
Model 1 vs Model 3b	0.16	37.4 vs 37.4	Keep model 1 based on parsimony
Model 1 vs Model 4	<0.01	37.4 vs 34.5	Keep model 4
Model 4 vs Model 4b	0.85	34.5 vs 36.4	Keep model 4

AIC, Akaike Information Criterion

Final model: model 1 (prevalence of *S. Typhi* of probable pathogens as sole predictor) was selected based on parsimony and ease of calculation, since calculation of ratios and log transformation is a complicating factor for policy makers.

The formula to calculate the predicted probabilities is presented below:

$$P(\text{Incidence} = \text{low}) = \frac{1}{1 + e^{-(LP_1)}}$$

$$P(\text{Incidence} = \text{medium}) = \frac{1}{1 + e^{-(LP_2)}} - \frac{1}{1 + e^{-(LP_1)}}$$

$$P(\text{Incidence} = \text{high}) = 1 - \frac{1}{1 + e^{-(LP_2)}}$$

LP refers to the linear predictor in a proportional odds logistic regression model. The *LP*s for the thresholds are defined as follows:

*LP*₁ (low vs. medium or high): *LP*₁ = 0.5846 (Intercept) - 0.0813 * prevalence of *S. Typhi* of pathogens

*LP*₂ (low/medium vs high): *LP*₂ = 2.3051 (Intercept) - 0.0813 * prevalence of *S. Typhi* of pathogens

*LP*₃ (high vs medium/low): *LP*₃ = -2.3051 (Intercept) + prevalence of *S. Typhi* of pathogens

Appendix 10 – Calibration plots: predicted probability vs observed proportion of the model for typhoid incidence level, 2017-2024

Low typhoid incidence vs medium and high typhoid incidence

Medium typhoid incidence vs low and high typhoid incidence

High typhoid incidence vs low and medium typhoid incidence

Appendix 11 – Decision curve analysis of the prediction model for typhoid incidence level, 2017-2024

Appendix 12 - Simulated predicted probabilities for range of prevalence of *S. Typhi* among probable pathogens for typhoid incidence levels according to the final model

Prevalence of <i>S. Typhi</i> among probable pathogens, %	Predicted probability for low typhoid incidence site, %	Predicted probability for medium typhoid incidence site, %	Predicted probability for high typhoid incidence site, %	Suggested interpretation for typhoid incidence
1	62.3	27.9	9.8	Low
5	54.4	32.5	13.0	Low
10	44.3	37.3	18.4	Low
15	34.7	40.1	25.2	Medium
20	26.1	40.3	33.6	Medium
25	19.0	37.7	43.2	High
30	13.5	33.1	53.3	High
40	6.5	21.5	72.0	High
50	3.0	11.7	85.3	High

Appendix 13 - Metrics from sentinel bloodstream infection calculated for *S. Paratyphi A* and non-typhoidal *S.*, 2017-2024

Study site: Project, Country, Locality (reference)	Paratyphoid A incidence estimate per 100,000 person-years (95% CI)	Number of <i>S.
